

## **Employee Attrition Analysis – HR Summary**

This project was completed to understand why employees leave the company and to identify employees who may be at a higher risk of resigning. By studying employee information such as job satisfaction, overtime, salary, work-life balance, and years of service, we found several important patterns.

The analysis shows that employees who work overtime regularly, have lower job satisfaction, or have spent fewer years with the company are more likely to leave. Some departments and job roles, especially Sales and Sales Representatives, experience a higher number of resignations than others. Although salary has some influence, it is not the only reason employees leave. Factors such as work-life balance, recognition, and career growth opportunities also play a major role.

To reduce employee attrition, the HR team should focus on employees who frequently work overtime or report low job satisfaction. Regular one-on-one discussions, career development plans, and better work-life balance initiatives can help improve employee retention. New employees should also receive additional support during their first few years, as this is when resignations are more common.

This analysis provides useful guidance for identifying employees who may need additional support. However, employee decisions are also influenced by personal reasons, family situations, and opportunities outside the company, which are not included in the available data. Therefore, the results should be used as a decision-support tool rather than the only basis for HR decisions.
